

# Desktop as a Service

The Secure RackTop DaaS solution provides DoD-strength secure, hosted desktops and applications that provide agility, security and peace of mind. Enjoy the benefits of our highest layers of security, a complete ecosystem and reliable support from our cybersecurity and virtual desktop experts. Here's what makes our Secure DaaS solution the clear winner above the rest.

SECURE

**RackTop's Secure DaaS is the right choice for any entity with data sensitivity and security concerns.** That's because there is no need to manage servers, hardware or software updates. Your desktops and applications are delivered and managed right from our secure, private cloud.

**RackTop makes it easy to address key security and compliance concerns by ensuring the appropriate access level for each employee or group.** Information created or accessed by contractors and seasonal employees never has to leave the data center. It stays safe with the hosted desktop.

**And you can configure the desktop environment for every individual and any situation the organization needs.** Eliminate data leakage and the unauthorized introduction of media and data into your secure environment.

**Eradicate vulnerabilities more quickly than ever, and eliminate the time-consuming and painstaking need to patch and update every desktop.** With RackTop's modern, efficient, and secure approach, a freshly patched and updated desktop is ready for every user each time they log in.

RackTop's secure desktop is delivered via a unique architecture with native data protection, isolation and micro-segmentation that reduces the risk of outages, data loss and problems that plague traditional end user and cloud environments.

**Deploy new software, applications and updates in minutes – not hours or days.** RackTop's architecture can prevent application compatibility issues and allows for the quick removal of retired software.

**RackTop's DaaS eliminates the burden that comes with maintaining an end user environment.** Switch to RackTop's DaaS for data security and simplified compliance with the lowest total cost of ownership. Layers of protection, segmentation, robust auditing and alerting assure the highest level of security.

**Manage which endpoints can connect to the desktops as well as their configuration from the cloud.** You can even approve the locations from which those endpoints will be allowed to connect. Rest assured your data is safe.

You always have complete visibility into your environment. RackTop's end to end auditing makes fulfilling compliance and auditing requirements a breeze. We offer complete packages to meet various regulatory and compliance requirements. Eliminates the need to expand and train internal staff on complex VDI and compliance requirements and issues.

**With our pay-as-you go model, your business can make the shift from capital expenditures to a predictable monthly expense.** Scale up to quickly to meet seasonal or surge needs, expand to new locations, or provide secure access to contract or temporary workers.

## Core Features:

Cloud-based desktop and app access

Endpoint device flexibility

End to end user and system auditing

Compliant with  
FINRA/SEC/CJIS/HIPPA/PCI

FIPS Certified Encryption

Predictable cost model

Business continuity / disaster-ready

Secure and reliable

Web filtering

IDS/IPS

Secure connectivity between endpoints  
and the cloud

Micro-segmentation and isolation

High availability with geo-redundancy

Secure, local printing and scanning

User behavior monitoring and traffic  
analytics
